The Human Heart

The human heart beats about 100,000 times per day, pumping roughly 7,500 litres of blood through the body in the same period.

A normal resting heart rate for adults is between 60 and 100 beats per minute. Athletes often have resting rates below 60 beats per minute.

The aorta is the largest artery in the body, carrying oxygen-rich blood from the left ventricle to the rest of the body.

The heart has four chambers: two atria and two ventricles. The left ventricle has the thickest wall because it pumps blood to the whole body.
