Python Basics

Python was created by Guido van Rossum and first released in 1991. Its design emphasises readability, using indentation instead of braces to define blocks.

Lists are mutable, meaning their contents can be changed after creation, while tuples are immutable and cannot be changed.

PEP 8 is Python's official style guide. It recommends four spaces per indentation level and a maximum line length of 79 characters.

A dictionary stores key-value pairs and looks up a key in constant time on average. List comprehensions provide a compact way to build lists.
