The Solar System

Jupiter is the largest planet in the solar system, with a mass greater than all other planets combined. Its Great Red Spot is a storm wider than the Earth.

Saturn's rings are made almost entirely of water ice, and span about 280,000 kilometres across, yet are only about 10 metres thick in places.

Neptune is the farthest planet from the Sun, orbiting at an average distance of 4.5 billion kilometres, and its winds reach 2,100 kilometres per hour.

Mars has the tallest volcano in the solar system, Olympus Mons, which is about 22 kilometres high, nearly three times the height of Mount Everest.
